No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence 118,

A.Map position: 2p12-2p12
C.Complex: An immunoglobulin heterotetramer subunit consists of two identical light (kai hain disulfide bonds: In some cases, such as IgA and IgM, the subunits associate into 1) C.Superfamily: immunoglobulin V region; immunoglobulin homology
C.Superfamily: immunoglobulin V region (Walker) #status predicted (*Mar)
F.13-12/Domain: signal sequence #status predicted (*Mar)
F.23-12/Pomain: immunoglobulin homology < IMM>
F.33-112/Domain: immunoglobulin homology < IMM>
F.46-56/Region: complementarity-determining 1
F.57-71/Region: complementarity-determining 2
F.57-71/Region: complementarity-determining 2

The invention relates to a novel human antibody (I), preferably a human monoclonal antibody which binds to an activation inducible lymphocyte immunomedulatory molecule (AILIM). (I) is useful for modulating signal transduction into a cell mediated by AILIM, for modulating spoiliferation of AILIM-expressing cells, and for inducing antibody-dependent cytotoxicity adiants AILIM-expressing cells and/or immune cytolysis or apoptosis of prophylaxis of delayed type allergy. (I) is useful for treating and preventing various diseases associated with AILIM-mediated costimulatory transduction, and for inhibiting the onset and/or prevention and/or treatment of rheumatoid arthritis, multiple to advancement of the diseases. (I) is useful for suppression, prevention and/or treatment of rheumatoid arthritis, multiple collinamatory dermatosis, systemic lupus erythematosus, insulin-dependent diabetes mellitus, psoriasis, autoimmune thyroiditis, speriasis, autoimmune thyroiditis, speriasis, autoimmune diabetes mellitus, psoriasis, autoimmune con allergic disorders, inflammation, graft versus host reaction, graft versus host immunity, specifically inflammatory intestinal disorders such as ulcerative collitis, pneumonia, hepatitis, nephritis, vasculitis, and collitis, pneumonia, immune, i.e., human anti-mouse antigenicity (HAMA) in a host.

The sequence represents the variable light chain segment of a human monoclonal antibody (HuMAb) against interleukin-1-alpha. The MAb is of subclass 1964 and binds to lymphokines/monokines with an affinity of 10(9)/M. The Mab or fragment (FV, single-chain FV, Fab or F(ab') 2) is used in the treatment of inflammation e.g. rheumatoid arthritis, osteoarthritis and inflammatory bowel diseases, and in the treatment of psoriasis, allergy, septic shock, graft vs host disease and tumours. The MAb or fragment can also be used for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                of Cynomologous Vkappa cDNA clone 4-10.
